SUMMARY

Senior Frontend Engineer, six years in production web platforms — the last four owning frontend architecture for Tapsi Shop, a high-traffic e-commerce platform. I work at the level of structure rather than screens: module boundaries, state ownership, rendering strategy, and the standards that keep a growing codebase fast to change. AI is normal engineering practice for me — Claude and LLM APIs in daily development and shipped in product.

CORE TECHNICAL SKILLS

Languages	TypeScript, JavaScript (ES2015+), HTML5, CSS3
Frameworks	React, Next.js (App Router, RSC, SSR/SSG, streaming, caching), React Native, Vue 3
Architecture	Frontend system design, Feature-Sliced Design, Atomic Design, monorepos (Nx, Turborepo)
State & Data	Redux Toolkit, Zustand, TanStack Query, SWR, GraphQL (Apollo), REST API design
UI & Design Systems	Design tokens, Storybook, TailwindCSS, shadcn/ui, Radix UI, accessibility (WCAG 2.1 AA)
Performance	Core Web Vitals, React Profiler, Lighthouse, bundle analysis, code splitting, Sharp
Testing & Quality	Jest, Vitest, React Testing Library, Cypress, Playwright, error boundaries, monitoring
Tooling	Git, Docker, GitLab CI/CD, Azure DevOps, Vite, Webpack, ESLint, Nx / Turborepo
AI Engineering	Claude / LLM APIs in product features; AI-assisted development workflows

PROFESSIONAL EXPERIENCE

Senior Frontend Engineer — Tapsi Shop Jun 2022 – Present · Tehran

E-commerce platform (tapsi.shop) with internal admin and vendor panels — Next.js, TypeScript, monorepo.

- Own the frontend architecture across the storefront, admin and vendor panels, introducing a Feature-Sliced Design module structure with explicit boundaries for state ownership, data flow and feature isolation — cutting cross-feature coupling and making parallel work safe.
- Improved Core Web Vitals and load performance by roughly 30% through a deliberate SSR/SSG and caching strategy, React Profiler and bundle analysis, and image optimization with Sharp.
- Designed and standardized a Storybook-documented design system on design tokens and Atomic Design, shared across three products; feature delivery accelerated by around 20% and UI drift between panels stopped.
- Introduced the standards the frontend runs on — typed API contracts, lint and CI gates, error boundaries and production error monitoring — and mentor engineers through structured code review and technical sessions; production bugs down roughly 20%.

Three production products in React, Next.js and TypeScript — a cryptocurrency trading platform, an e-commerce storefront, and an internal knowledge management system.

- Engineered a real-time, data-dense trading interface with live price and order-book updates, solving the render-throughput and state-consistency problems that come with high-frequency data.
- Built the shared component library used across all three products, implemented JWT auth with role-based access control, and cut low-bandwidth load times with code splitting and cache-aware fetching (SWR).

SELECTED PROJECTS

NovaStudio github.com/alireza-akbarzadeh/NovaStudio

AI-native collaborative IDE in the browser — editor, AI, git and terminal in one tab. A Monaco workspace running real Node in WebContainers, a full git loop with GitHub clone and publish, live multiplayer editing (Liveblocks + Yjs), and AI chat grounded in the open files and project tree.

Next.js 16, React 19, TypeScript, Convex, Clerk, Vercel AI SDK

Luxe

A full e-commerce MVP built end to end across separate frontend and backend, with AI integrated into the product experience.

Streaming platform

A video platform in Nuxt 4 and Vue 3: Postgres / Drizzle, session auth with RBAC, a custom-skinned player and ranked recommendation feeds — built architecture-first, every decision recorded as an ADR.
